7	Other governed write routes	3
8	Mode honesty and production boundary	3

1 Runtime identity

- **Base path:** /api/v20
- **Legacy alias:** /api/v19 remains accepted for inherited clients. V20 clients use /api/v20.
- **Packaged runtime:** stateful synthetic Mock Connected; no external effects.
- **Connected behavior:** the packaged server refuses `CONNECTED` rather than serving a fixture under a live label.

2 Bootstrap and projection

2.1 Create or resume a session

GET /bootstrap?mode={mode}&case_id={case_id}&actor={actor}

Creates or resumes a namespaced session, returns the available cases, the validated projection and the Experience Context Envelope.

2.2 Read the bitemporal projection

GET /cases/{case_id}/projection?session_id={session_id}&as_of_date={date}&lens_id={lens_id}

Returns the complete page-wide projection as known at the requested date. `lens_id` may change ranking, emphasis and policy requirements; it must not change the underlying facts hash.

2.3 Search and resolve objects

- GET /cases/{case_id}/search?q={query} searches the loaded projection.
- GET /cases/{case_id}/objects/{object_id} resolves a generic projection object for Object Aperture.
- GET /cases/{case_id}/replay?event_id={event_id}&as_of_date={date} returns event-derived read-only replay.

3 Source and compiler routes

3.1 Intake and jobs

- POST /cases/{case_id}/ingest queues file, local-path or URL intake.
- GET /jobs/{job_id} polls the compiler job and returns the completed projection when available.

3.2 Source and semantic collections

- GET /cases/{case_id}/sources returns Source Library records and immutable versions.
- GET /cases/{case_id}/inbox returns Vault Inbox arrivals.
- GET /cases/{case_id}/claims returns claims and exact locators.
- GET /cases/{case_id}/questions returns the governed question spine.
- GET /cases/{case_id}/cells returns inspectable workbook cells and formulas.
- GET /cases/{case_id}/coverage returns coverage limits and pipeline issues.
- GET /cases/{case_id}/bindings returns claim-question and position-model bindings.
- GET /cases/{case_id}/compiler-report returns compiler counts, versions and projection hash.

3.3 Compiler proposals

GET /cases/{case_id}/compiler-proposals

Returns candidate discrepancies, deterministic derivations, AI hypotheses and spine-change proposals. These are proposals rather than admitted institutional truth.

POST /cases/{case_id}/compiler-proposals/{kind}/{proposal_id}/review

Records the professional disposition for one proposal. `kind` is `discrepancy`, `derivation`, `hypothesis` or `spine`.

4 Governed missions

4.1 Prepare a mission

POST /cases/{case_id}/missions/{mission_id}/prepare

Creates a no-effect mission draft with objective, permitted and prohibited sources, confidentiality policy, data-egress policy, stop condition, reviewer and authority class.

4.2 Run a policy-safe mission

POST /cases/{case_id}/missions/{mission_id}/run

The packaged reference runtime runs only policy-safe synthetic mission classes. Human-contact, physical-test and non-auto missions return `MISSION_AUTHORITY_REQUIRED`. Results enter as a new synthetic source and review-required claim; they are never silently admitted.

5 Admission and transition

5.1 Admit a professional treatment

`POST /cases/{case_id}/events/{event_id}/admit`

Requires treatment ID and hash, source version, actor, as-of context, both temporal dates and idempotency key. A successful admission creates the server-side run and Candidate.

5.2 Prepare selected changes

`POST /runs/{run_id}/prepare`

Requires explicit valid change IDs. Zero selection and any ID outside the transition's affected set are rejected.

6 Authority, execution and settlement

6.1 Attest an admissible course

`POST /runs/{run_id}/authority/attest`

Creates a scoped authority record. The server verifies run, Candidate, open Human Stop, course, authenticated actor, authority assignment, artifact hash and idempotency semantics. Incompatible attestations are rejected.

6.2 Deliver an execution package

`POST /execution-packages/{package_id}/send`

Returns synthetic server acknowledgment or failure. No success appears before the response. A `DEFER` course creates no executable package.

6.3 Settle canonical state

`POST /runs/{run_id}/settle`

Validates selected changes, Human Stops, scoped authority, course-specific execution acknowledgment, blocked scope and partial-settlement boundaries. The server returns the canonical Current state, Registry event and replay identity. The browser does not invent the result.

7 Other governed write routes

- `POST /cases/{case_id}/open-deal` records structured case opening.
- `POST /cases/{case_id}/notes` records a professional annotation or review note.
- `POST /cases/{case_id}/ic-record` records an institutional IC act.
- `POST /cases/{case_id}/sources/{source_id}/remove` retires a source from Current while preserving history.
- `POST /cases/{case_id}/work-items/{work_item_id}/prepare` creates an internal work draft without claiming external dispatch.

8 Mode honesty and production boundary

A bootstrap request with `mode=CONNECTED` receives HTTP 503 and `CONNECTED_BACKEND_NOT_CONFIGURED`. The packaged server never serves fixture data under the Connected label.

The API is a synthetic reference implementation. It does not claim production SSO/RBAC, tenant-aware persistence, a live research service, external delivery, Fabrizio's production compiler/Case Store or Anto's independently deployed production runtime.
