V19.B Release and Acceptance Report

Corrective integrity, bitemporality, generalization and transition-integration release over V19.0.0.

RELEASE	STATUS	EVIDENCE
V19.B / 19.1.0	Complete synthetic integration/demo build	22 / 22 checks passed

This report is the authoritative V19.B addendum. The complete V19 professional documentation remains applicable for unchanged product surfaces.

Release decision

V19.B preserves the V18/V19 product architecture. It corrects six implementation and evidence defects that prevented V19.0.0 from serving as reliable proof of case generalization, historical reconstruction, epistemic discipline and transition integration.

The bundled runtime is a stateful synthetic reference API. Connected mode is deliberately refused until a real backend is supplied. The package creates no external effects.

PASS - 22 of 22 V19.B acceptance and regression checks

Six corrections

#	Correction	V19.B result
1	Distinct Orion case	A 42-claim growth-equity case built on ARR, retention, pipeline, onboarding, efficiency, runway, security and milestone-linked primary capital. Exact normalized statement overlap with Keystone: 0.0% .
2	Bitemporality	Both dates on every fixture claim, source event and Registry event. Date-driven as-of projections. Replay derived from Registry events rather than stored snapshots.
3	Institutional act	A fifth epistemic class for the firm's own decisions and judgments. Firm EBITDA at 11.4 and all IC decision claims reclassified.
4	Typed contracts and mapping	Eight typed schemas. Pure Python and JavaScript mapping from 18 frozen engine fields plus the nineteenth integration binding field, <code>source_event_id</code> .
5	Transition objects exercised	One Human Stop and one blocked component render end-to-end. Settlement without scoped authority is refused. Blocked scope needs explicit bounded partial settlement.
6	Canonical pricing language	The product now uses approved EV ceiling . Package-wide text and PDF regression scan passes.

Acceptance evidence

The executable suite is stored at `08_TEST_EVIDENCE/run_v19b_tests.py`. Machine-readable results are in `V19B_TEST_RESULTS.json`. The suite starts the packaged server, exercises positive and negative API paths, validates schemas and opens the product in Chromium for UI assertions.

Measured results

Measure	Result	Meaning
Orion statement overlap	0.0%	Required: below 20%
Historical Orion claims	6 / 42	Known 12 May / known 26 Aug
Keystone claim classes	10 / 11 / 18 / 14 / 22	asserted / observed / derived / attested / institutional act
Public schemas	8	All structurally typed
Transition outputs	4	All validate at zero errors
Adapter implementations	2	Python and browser JavaScript
Human Stop no-authority settlement	HTTP 409	Refused by server
Blocked settlement without partial flag	HTTP 409	Refused by server
V19.B acceptance suite	22 / 22	PASS

Negative paths proved

- Bundled Connected mode refuses synthetic fixture data.
- Authority before explicit preparation is rejected.
- A mismatched Candidate is rejected.
- A selected change outside the transition output is rejected.
- Human Stop settlement without a run/Candidate/stop-scoped authority record is rejected.
- Blocked scope cannot disappear through ordinary settlement.
- External-package success appears only after server acknowledgment.
- Invalid temporal queries are rejected rather than relabelled.

Orion: distinct growth grammar and historical replay

The same frontend renders Orion without a case-specific component fork. The Scenario Lab uses ARR, NRR and runway rather than buyout metrics. The as-of selector reconstructs the case by knowledge date, and replay steps are derived from Registry events carrying both temporal axes.

Browser evidence: Orion replay rendered from the event log with effective date, known-at timestamp, source state and stable hash.

Human Stop: authority is a server gate

The retention restatement produces a real Human Stop in the transition projection. The UI exposes its ID, reason, required authority level, authority verb and downstream scope. The bundled server refuses settlement until an authority record is scoped to the same run, Candidate and stop.

- Retention basis retained effective 2026-08-30 known 2026-08-32 08:00:00 UTC
- Renewed cohort coverage gap identified effective 2026-07-31 known 2026-08-24 09:00:00 UTC
- Growth investment approved in milestone transition effective 2026-08-01 known 2026-08-01 18:00:00 UTC

Open replay

Browser evidence: populated authority-requiring Human Stop in Change Impact.

Blocked scope: honest partial settlement

A separate Orion event produces a blocked renewal-forecast component because two cohorts lack an admissible source route. The component remains visible with its reason code, explanation, downstream scope and resolution route. Independent changes may settle only when bounded partial settlement is explicit.

The screenshot displays the PANTA V19.B interface, which is a simulation environment for a synthetic API. The interface is divided into several sections:

- Header:** Includes the PANTA V19.B logo, a status bar indicating "MOCK CONNECTED" and "Stateful synthetic API - no external effects", and a "SIMULATED_SERVER" label.
- Left Sidebar:** Contains navigation links for "COMMAND" (Fund Command, Deal Command), "CASE ROOMS" (Sources, Work, Foundations, Unknowns, Shadow IC, Scenario Lab), "ARTIFACTS", "Registry", "Replay", "CURRENT CHANGE" (Change Arrival, Change Review, Change Impact), "Action Frontier", "Decision Room", "Execution Room", and "Settled State".
- Main Content Area:**
 - CURRENT OBJECTIVE:** "Determine the size and conditions of a primary investment using ARR quality, retention, growth efficiency, onboarding capacity and runway." It includes a dropdown for "PROJECT-ORION" and a "Known at 2026-08-26" date.
 - 03 - CHANGE IMPACT:** A section showing the impact of changes. It includes a table with columns for "BECOMES_CONTESTED", "Survives", "Blocked", "Human Stops", and "Blocked components".
 - ORDERED TRANSITION:** A section showing the progression of events. It includes a table with columns for "01", "02", and "03". The "03" row is highlighted and labeled "Blocked".
 - CANDIDATE READINESS:** A section showing the readiness of a candidate. It includes a table with columns for "CAND - 888045B599FE", "STATUS", "EFFECTIVE DATE", "KNOWN AT", "COVERAGE LIMITS", and "BLOCKED".
- Bottom Section:** A "CAUSAL TIME EVENT LOG" showing a sequence of events from "Orion growth case opened" to "Growth invest approved in milestone tran".

Browser evidence: populated blocked component with an explicit reason and closure route.

Integration boundary and remaining production work

V19.B completes the packaged mapping contract, not the external production systems. The pure adapter preserves Anto's frozen output and exposes it to the frontend without moving economic or institutional truth into the browser.

Frozen engine output

```
schema_version, engine_version, run_id, case_id, prior_state_id, policy_refs, affected_set,
ordered_transitions, rule_switches, recomputed_values, unchanged_objects, human_stops, blocked_components,
coverage_limits, invariant_checks, candidate_current_approved_delta, partial_settlement_status, replay_hash
```

Integration binding

source_event_id binds the result to the admitted event. This is the nineteenth required integration field; it is not counted as one of the 18 frozen engine output fields.

Explicitly not certified by this release

- Production authentication, SSO, enterprise RBAC or real authority infrastructure.
- Production Live Investment Case persistence, tenancy, migration and retention controls.
- Real external messages, offers, approvals or write-back.
- Fabrizio's production compiler/Case Store endpoint.
- Anto's separate production Transition Engine implementation and full 22-case runtime conformance evidence.

Authoritative working baseline

V19.B product and source experience, protected by V18 integrity rules and governed by frozen machine contracts.
